Abstract:

The calvaria of an adult Australopithecus boisei from Area 104, Koobi Fora, Lake Turkana, is described. T KNM-ER 23000, comes from sediments dated to about 1.9 Ma. It consists of the frontal, both parietals, bot of the occipital as well as two small pieces of sphenoid, and a mandibular tooth root. The specimen is presu male, based on its size and the great development of features associated with the masticatory apparatus. KN close in general size and shape to KNM-ER 406, KNM-ER 13750, and Olduvai Hominid 5 and it has a mix seen in these three roughly contemporaneous crania. The frontal, especially the tori, resembles that of OH 5 most like those of KNM-ER 13750; the occipital is like those of the two other Turkana specimens, and the mixture of features from all of these, This specimen adds to our knowledge of variability in A. boisei.
